Topic: Latest Norm AMP

Summary:

AMP is a web design approach focused on delivering faster load times, better performance, and an improved mobile user experience. Promoted by Google, it has become an important trend for optimizing content and ads. Its main goal is to engage users by providing near instant page loading.

Example:

An example for a web page that nowadays uses AMP is eBay because it uses it across many of its product pages to ensure fast loading times on mobile devices, creating a smoother and more efficient shopping experience. By reducing page weight and limiting heavy scripts.

AMP also allows users to browse products, view details, and make decisions quickly.

Mockup:

Implementing AMP in our application would take considerable time because it requires building and maintaining separate page versions and restructuring the existing code to comply with AMP's strict limitations. Since AMP restricts custom JavaScript, key interactive features like the shopping cart would need to be redesigned or moved outside the AMP flow, increasing development and maintenance effort.
